REGISTER NO:231501167

SEMESTER: II

ACADEMIC YEAR: 2023 - 2024

S. No.	Date	Title	Page No.	Teacher's Signature / Remarks
Introduction to python-Variables-Datatypes-Input/Output-Formatting				
1.1	6.3.24	Converting Input Strings		
1.2	6.3.24	Gross salary		
1.3	6.3.24	Square Root		
1.4	6.3.24	Gain percent		
1.5	6.3.24	Deposits		
1.6	6.3.24	Carpenter		
Operators in Python				
2.1	20.3.24	Widgets and Gizmos		
2.2	20.3.24	Doll Sings		
2.3	20.3.24	Birthday party		
2.4	20.3.24	Hamming Weight		
2.5	20.3.24	Compound Interest		
2.6	20.3.24	Eligible to donate blood		
2.7	20.3.24	C or D		
2.8	27.3.24	Troy Battle		
2.9	27.3.24	Tax and Tip		

2.10	27.3.24	Return last digit of the given number		
------	----------------	---------------------------------------	--	--

Selection Structures in Python

3.1	27.3.24	Admission eligibility		
3.2	27.3.24	Classifying triangles		
3.3	27.3.24	Electricity Bill		
3.4	10.4.24	IN/OUT		
3.5	10.4.24	Vowel or Constant		
3.6	10.4.24	Leap Year		
3.7	10.4.24	Month name to Days		
3.8	10.4.24	Pythagorean triple		
3.9	17.4.24	Second Last Digit		
3.10	17.4.24	Chinese Zodiac		

Algorithmic Approach: Iteration Control Structures

4.1	17.4.24	Factors of a Number		
4.2	17.4.24	Non-Repeated Digits Count		
4.3	17.4.24	Prime Checking		
4.4	24.4.24	Next Perfect Square		
4.5	24.4.24	Nth Fibonacci		
4.6	24.4.24	Disarium Number		
4.7	24.4.24	Sum of Series		
4.8	24.4.24	Unique Digits Count		
4.9	24.4.24	Product of single digits		
4.10	1.5.24	Perfect Square After adding One		

Strings in Python

5.1	1.5.24	Count chars		
-----	---------------	-------------	--	--

5.2	1.5.24	Decompress the String		
5.3	1.5.24	First N Common Characters		
5.4	1.5.24	Remove Characters		
5.5	1.5.24	Remove Palindrome Words		
5.6	1.5.24	Return Second Word in Uppercase		
5.7	1.5.24	Reverse String		
5.8	1.5.24	String characters balance Test		
5.9	1.5.24	Unique Names		
5.10	1.5.24	Username Domain Extension		

List in Python

6.1	8.5.24	Monotonic array		
6.2	8.5.24	Check pair with difference k .		
6.3	8.5.24	Count Elements		
6.4	8.5.24	Distinct Elements in an Array		
6.5	8.5.24	Element Insertion		
6.6	8.5.24	Find the Factor		
6.7	8.5.24	Merge list		
6.8	8.5.24	Merge Two Sorted Arrays Without Duplication		
6.9	8.5.24	Print Element Location		
6.10	8.5.24	Strictly increasing		

Tuples & Set

7.1	15.5.24	Binary String		
7.2	15.5.24	Check Pair		

7.3	15.5.24	DNA Sequence		
7.4	15.5.24	Print repeated no		
7.5	15.5.24	Remove repeated		
7.6	15.5.24	malfunctioning keyboard		
7.7	15.5.24	American keyboard		

Dictionary

8.1	22.5.24	Uncommon Words		
8.2	22.5.24	Sort Dictionary By Values Summation		
8.3	22.5.24	Winner Of Election		
8.4	22.5.24	Student Record		
8.5	22.5.24	Scramble Score		

Functions

9.1	29.5.24	Abundant Number		
9.2	29.5.24	Automorphic number or not		
9.3	29.5.24	Check Product of Digits		
9.4	29.5.24	Christmas Discount		
9.5	29.5.24	Coin Change		
9.6	29.5.24	Difference Sum		
9.7	29.5.24	Ugly number		

Searching & Sorting

10.1	5.6.24	Merge Sort		
10.2	5.6.24	Bubble Sort		
10.3	5.6.24	Peak Element		
10.4	5.6.24	Binary Search		
10.5	5.6.24	Frequency of Numbers

Converting Input Strings

Write a program to convert strings to an integer and float and display its type.

Sample Output:

10,<class 'int'>

10.9,<class 'float'>

For example:

Input	Result
10	10,<class 'int'>
10.9	10.9,<class 'float'>

```

a=input()
b=input()
c=int(a)
d=float(b)
print(c,type(c),sep=",")
print("{:0.1f}".format(d),type(d),sep=",")

```

	Input	Expected	Got	
✓	10 10.9	10,<class 'int'> 10.9,<class 'float'>	10,<class 'int'> 10.9,<class 'float'>	✓
✓	12 12.5	12,<class 'int'> 12.5,<class 'float'>	12,<class 'int'> 12.5,<class 'float'>	✓
✓	89 7.56	89,<class 'int'> 7.6,<class 'float'>	89,<class 'int'> 7.6,<class 'float'>	✓
✓	55000 56.2	55000,<class 'int'> 56.2,<class 'float'>	55000,<class 'int'> 56.2,<class 'float'>	✓
✓	2541 2541.679	2541,<class 'int'> 2541.7,<class 'float'>	2541,<class 'int'> 2541.7,<class 'float'>	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Gross Salary

Ramesh's basic salary is input through the keyboard. His dearness allowance is 40% of his basic salary, and his house rent allowance is 20% of his basic salary. Write a program to calculate his gross salary.

Sample Input:

10000

Sample Output:

16000

For example:

Input	Result
10000	16000

```
s=int(input())
da=s*0.4
ha=s*0.2
print(int(s+da+ha))
```

	Input	Expected	Got	
✓	10000	16000	16000	✓
✓	20000	32000	32000	✓
✓	28000	44800	44800	✓
✓	5000	8000	8000	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Name: SURYA PRAJIN S

Square Root

Write a simple python program to find the square root of a given floating point number. The output should be displayed with 3 decimal places.

Sample Input:

8.00

Sample Output:

2.828

For example:

Input	Result
14.00	3.742

```
import math
a=float(input())
s=math.sqrt(a)
print("{:.3f}".format(s))
```

	Input	Expected	Got	
✓	8.00	2.828	2.828	✓
✓	14.00	3.742	3.742	✓
✓	4.00	2.000	2.000	✓
✓	487	22.068	22.068	✓

Passed all tests! ✓

Correct

Gain percent

Alfred buys an old scooter for Rs. X and spends Rs. Y on its repairs. If he sells the scooter for Rs. Z ($Z > X + Y$). Write a program to help Alfred to find his gain percent. Get all the above-mentioned values through the keyboard and find the gain percent.

Input Format:

The first line contains the Rs X

The second line contains Rs Y

The third line contains Rs Z

Sample Input:

10000

250

15000

Sample Output:

46.34 is the gain percent.

For example:

Input	Result
45500	30.43 is the gain percent.
500	
60000	

```
buys=int(input())
```

```
repair=int(input())
```

```
sells=int(input())
```

```

g=((sells-(buys+repair))/(buys+repair))*100)
print("{:.2f}".format(g), "is the gain percent.")

```

	Input	Expected	Got	
✓	10000 250 15000	46.34 is the gain percent.	46.34 is the gain percent.	✓
✓	45500 500 60000	30.43 is the gain percent.	30.43 is the gain percent.	✓
✓	5000 0 7000	40.00 is the gain percent.	40.00 is the gain percent.	✓
✓	12500 5000 18000	2.86 is the gain percent.	2.86 is the gain percent.	✓

Deposits

In many jurisdictions, a small deposit is added to drink containers to encourage people to recycle them. In one particular jurisdiction, drink containers holding one liter or less have a \$0.10 deposit and drink containers holding more than one liter have a \$0.25 deposit. Write a program that reads the number of containers of each size(less and more) from the user. Your program should continue by computing and

displaying the refund that will be received for returning those containers. Format the output so that it includes a dollar sign and always displays exactly two decimal places.

Sample Input

10

20

Sample Output

Your total refund will be \$6.00.

For example:

Input	Result
20	Your total refund will be \$7.00.
20	

```
a=int(input())
b=int(input())
c=a*0.1
d=b*0.25
e=c+d
print("Your total refund will be ${:.2f}.".format(e))
```

	Input	Expected	Got	
✓	20 20	Your total refund will be \$7.00.	Your total refund will be \$7.00.	✓
✓	11 22	Your total refund will be \$6.60.	Your total refund will be \$6.60.	✓
✓	123 200	Your total refund will be \$62.30.	Your total refund will be \$62.30.	✓
✓	76 38	Your total refund will be \$17.10.	Your total refund will be \$17.10.	✓

Carpenter

Justin is a carpenter who works on an hourly basis. He works in a company where he is paid Rs 50 for an hour on weekdays and Rs 80 for an hour on weekends. He works 10 hrs more on weekdays than weekends. If the salary paid for him is given, write a program to find the number of hours he has worked on weekdays and weekends.

Hint:

If the final result(hrs) are in -ve convert that to +ve using abs() function

The abs() function returns the absolute value of the given number.

number = -20

absolute_number = abs(number)

```
print(absolute_number)
# Output:20
```

Sample Input:

450

Sample Output:

weekdays 10.38

weekend 0.38

For example:

Input	Result
450	weekdays 10.38 weekend 0.38

```
s=int(input())
a=(500-s)/130
print("weekdays {:.2f}".format(abs(a)+10))
print("weekend {:.2f}".format(abs(a)))
```

	Input	Expected	Got	
✓	450	weekdays 10.38 weekend 0.38	weekdays 10.38 weekend 0.38	✓
✓	500	weekdays 10.00 weekend 0.00	weekdays 10.00 weekend 0.00	✓
✓	10000	weekdays 83.08 weekend 73.08	weekdays 83.08 weekend 73.08	✓
✓	6789	weekdays 58.38 weekend 48.38	weekdays 58.38 weekend 48.38	✓

Admission Eligibility

Write a program to find the eligibility of admission for a professional course based on the following criteria:

Marks in Maths ≥ 65

Marks in Physics ≥ 55

Marks in Chemistry ≥ 50

Or

Total in all three subjects ≥ 180

Sample Test Cases

Test Case 1

Input

70

60

80

Output

The candidate is eligible

Test Case 2

Input

50

80

80

Output

The candidate is eligible

Test Case 3

Input

50

60

40

Output

The candidate is not eligible

For example:

Input	Result
50	The candidate is eligible
80	
80	

```
a=int(input())
b=int(input())
c=int(input())
if(a>=65 and b>=55 and c>=50):
    print("The candidate is eligible")
elif(a+b+c>=180):
    print("The candidate is eligible")
else:
    print("The candidate is not eligible")

Classifying Triangles

A triangle can be classified based on the lengths of its sides as equilateral, isosceles or scalene. All three sides of an equilateral triangle have the same length. An isosceles triangle has two sides that are the same length, and a third side that is a different length. If all of the sides have different lengths then the triangle is scalene.

Write a program that reads the lengths of the three sides of a triangle from the user. Then display a message that states the triangle's type.

Sample Input 1

60

60

60

Sample Output 1

That's a equilateral triangle

For example:

Input	Result
40	That's a isosceles triangle
40	
80	

```
a=int(input())
```

```
b=int(input())
```

```
c=int(input())
```

```
if(a==b and b==c):
```

```
    print("That's a equilateral triangle")
```

```
elif(a!=b and b==c or a==b and b!=c):
```

```
    print("That's a isosceles triangle")
```

```
elif(a!=b and b!=c):
```

```
    print("That's a scalene triangle")
```

	Input	Expected	Got	
✓	60 60 60	That's a equilateral triangle	That's a equilateral triangle	✓
✓	40 40 80	That's a isosceles triangle	That's a isosceles triangle	✓
✓	50 60 70	That's a scalene triangle	That's a scalene triangle	✓
✓	50 50 80	That's a isosceles triangle	That's a isosceles triangle	✓
✓	10 10 10	That's a equilateral triangle	That's a equilateral triangle	✓

Electricity Bill

Write a program to calculate and print the Electricity bill where the unit consumed by the user is given from test case. It prints the total amount the customer has to pay. The charge are as follows:

Unit	Charge / Unit
Upto 199	@1.20
200 and above but less than 400	@1.50
400 and above but less than 600	@1.80
600 and above	@2.00

If bill exceeds Rs.400 then a surcharge of 15% will be charged and the minimum bill should be of Rs.100/-

Sample Test Cases

Test Case 1

Input

50

Output

100.00

Test Case 2

Input

300

Output

517.50

For example:

Input	Result
500	1035.00

```
a=float(input())
```

```
b=0
```

```
if(a<=199):
```

```
    b=a*1.2
```

```
elif(200<=a<400):
```

```
    b=a*1.5
```

```
elif(400<=a<600):
```

```
    b=a*1.8
```

```
elif(a>600):
```

```
    b=a*2.0
```

```

if (int(b)<100):

    print(" {:.2f} ".format(100))

else:

    if(b>400.00):

        print(" {:.2f} ".format((b+(b*0.15)))))

    else:

        print(" {:.2f} ".format(b))

```

	Input	Expected	Got	
✓	50	100.00	100.00	✓
✓	100.00	120.00	120.00	✓

IN/OUT

Ms. Sita, the faculty handling programming lab for you is very strict. Your seniors have told you that she will not allow you to enter the week's lab if you have not completed atleast half the number of problems given last week. Many of you didn't understand this statement and so they requested the good programmers from your batch to write a program to find whether a student will be allowed into a week's lab given the number of problems given last week and the number of problems solved by the student in that week.

Input Format:

Input consists of 2 integers.

The first integer corresponds to the number of problems given and the second integer corresponds to the number of problems solved.

Output Format:

Output consists of the string “IN” or “OUT”.

Sample Input and Output:

Input

8

3

Output

OUT

For example:

Input	Result
8	OUT

Input	Result
3	

```
a=int(input())
```

```
b=int(input())
```

```
c=(a/2)
```

```
if(c>b):
```

```
    print("OUT")
```

```
else:
```

```
    print("IN")
```

	Input	Expected	Got	
✓	8 3	OUT	OUT	✓
✓	8 5	IN	IN	✓
✓	20 9	OUT	OUT	✓
✓	50 31	IN	IN	✓

Vowel or Consonant

In this exercise you will create a program that reads a letter of the alphabet from the user. If the user enters a, e, i, o or u then your program should display a message indicating that the entered letter is a vowel. If the user enters 'y' then your program should display a message indicating that sometimes y is a vowel, and sometimes

y is a consonant. Otherwise your program should display a message indicating that the letter is a consonant.

Sample Input 1

i

Sample Output 1

It's a vowel.

Sample Input 2

y

Sample Output 2

Sometimes it's a vowel... Sometimes it's a consonant.

Sample Input3

c

Sample Output 3

It's a consonant.

For example:

Input	Result
y	Sometimes it's a vowel... Sometimes it's a consonant.
u	It's a vowel.
p	It's a consonant.

```
a=input()
```

```
if(a=='a' or a=='e' or a=='i' or a=='o' or a=='u'):
```

```
    print("It's a vowel.")
```

```
elif(a=='y'):
```

```
print("Sometimes it's a vowel... Sometimes it's a consonant.")
```

else:

```
print("It's a consonant.")
```

	Input	Expected	Got
✓	i	It's a vowel.	It's a vowel.
✓	y	Sometimes it's a vowel... Sometimes it's a consonant.	Sometimes it's a
✓	c	It's a consonant.	It's a consonant
✓	e	It's a vowel.	It's a vowel.
✓	r	It's a consonant.	It's a consonant

Leap Year

Most years have 365 days. However, the time required for the Earth to orbit the Sun is actually slightly more than that. As a result, an extra day, February 29, is included in some years to correct for this difference. Such years are referred to as leap years. The rules for determining whether or not a year is a leap year follow:

- Any year that is divisible by 400 is a leap year.
- Of the remaining years, any year that is divisible by 100 is not a leap year.
- Of the remaining years, any year that is divisible by 4 is a leap year.
- All other years are not leap years.

Write a program that reads a year from the user and displays a message indicating whether or not it is a leap year.

Sample Input 1

1900

Sample Output 1

1900 is not a leap year.

Sample Input 2

2000

Sample Output 2

2000 is a leap year.

```
year=int(input())
if(year%400==0):
    print(year,"is a leap year.")
else:
    print(year,"is not a leap year.")
```

	Input	Expected	Got	
✓	1900	1900 is not a leap year.	1900 is not a leap year.	✓
✓	2000	2000 is a leap year.	2000 is a leap year.	✓
✓	2100	2100 is not a leap year.	2100 is not a leap year.	✓
✓	2400	2400 is a leap year.	2400 is a leap year.	✓

Passed all tests! ✓

Month name to days

The length of a month varies from 28 to 31 days. In this exercise you will create a program that reads the name of a month from the user as a string. Then your program should display the number of days in that month. Display “28 or 29 days” for February so that leap years are addressed.

Sample Input 1

February

Sample Output 1

February has 28 or 29 days in it.

Sample Input 2

March

Sample Output 2

March has 31 days in it.

Sample Input 3

April

Sample Output 3

April has 30 days in it.

For example:

Input	Result
February	February has 28 or 29 days in it.

Input	Result
March	March has 31 days in it.

```
m=input()
if(m=="January"):
    print(m,"has 31 days in it.")
elif(m=="February"):
    print(m,"has 28 or 29 days in it.")
elif(m=="March"):
    print(m,"has 31 days in it.")
elif(m=="April"):
    print(m,"has 30 days in it.")
elif(m=="May"):
    print(m,"has 31 days in it.")
elif(m=="June"):
    print(m,"has 30 days in it.")
elif(m=="July"):

Pythagorean triple

Three numbers form a Pythagorean triple if the sum of squares of two numbers is equal to the square of the third.

For example, 3, 5 and 4 form a Pythagorean triple, since $3^2 + 4^2 = 25 = 5^2$. You are given three integers, a, b, and c. They need not be given in increasing order. If they form a Pythagorean triple, then print "Yes", otherwise, print "No".

Sample Input

3

5

4

Sample Output

Yes

For example:

Input	Result
3	Yes
4	
5	

```
a=int(input())
```

```
b=int(input())
```

```
c=int(input())
```

```
if(a*a+b*b==c*c):
```

```
print("yes")  
elif(a*a+c*c==b*b):  
    print("yes")  
elif(c*c+b*b==a*a):  
    print("yes")  
else:  
    print("no")
```

Second last digit

Write a program that returns the second last digit of the given number. Second last digit is being referred to the digit in the tens place in the given number.

For example, if the given number is 197, the second last digit is 9.

Note1 - The second last digit should be returned as a positive number. i.e. if the given number is -197, the second last digit is 9.

Note2 - If the given number is a single digit number, then the second last digit does not exist. In such cases, the program should return -1. i.e. if the given number is 5, the second last digit should be returned as -1.

For example:

Input	Result
197	9

```
a=int(input())
b=str(abs(a))
l=len(b)
if(l>1):
    print(int(b[-2]))
else:
    print(-1)
```

	Input	Expected	Got	
✓	197	9	9	✓
✓	-197	9	9	✓
✓	5	-1	-1	✓
✓	123456	5	5	✓
✓	8	-1	-1	✓

Chinese Zodiac

The Chinese zodiac assigns animals to years in a 12 year cycle. One 12 year cycle is shown in the table below. The pattern repeats from there, with 2012 being another year of the dragon, and 1999 being another year of the hare.

Year Animal

2000 Dragon

2001 Snake

2002 Horse

2003 Sheep

2004 Monkey

2005 Rooster

2006 Dog

2007 Pig

2008 Rat

2009 Ox

2010 Tiger

2011 Hare

Write a program that reads a year from the user and displays the animal associated with that year. Your program should work correctly for any year greater than or equal to zero, not just the ones listed in the table.

Sample Input 1

2010

Sample Output 1

2010 is the year of the Tiger.

Sample Input 2

2020

Sample Output 2

2020 is the year of the Rat.

```
a=int(input())
b=a%100
c=b%12
if(c==0):
    print(a,"is the year of the Dragon.")
elif(c==1):
    print(a,"is the year of the Snake.")
elif(c==2):
    print(a,"is the year of the Horse.")
elif(c==3):
    print(a,"is the year of the Sheep.")
elif(c==4):
    print(a,"is the year of the Monkey.")
elif(c==5):
    print(a,"is the year of the Rooster.")
elif(c==6):
    print(a,"is the year of the Dog.")
elif(c==7):
    print(a,"is the year of the Pig.")
elif(c==8):
    print(a,"is the year of the Rat.")
```

```

elif(c==9):
    print(a,"is the year of the Ox.")

elif(c==10):
    print(a,"is the year of the Tiger.")

elif(c==11):
    print(a,"is the year of the Hare.")

```

	Input	Expected	Got	
✓	2010	2010 is the year of the Tiger.	2010 is the year of the Tiger.	✓
✓	2020	2020 is the year of the Rat.	2020 is the year of the Rat.	✓

Factors of a number

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number).

For example:

Input	Result	
20	1 2 4 5 10 20	

```
k=int(input())
```

```
l=[]
```

```
for i in range(1,k+1):
```

```
    if(k%i==0):
```

```
        l.append(i)
```

```
for j in l:
```

```
    print(j,end=' ')
```

	Input	Expected	Got	
✓	20	1 2 4 5 10 20	1 2 4 5 10 20	✓

Non Repeated Digit Count

Write a program to find the count of non-repeated digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number ≥ 1 and ≤ 25000 .

Some examples are as below.

If the given number is 292, the program should return 1 because there is only 1 non-repeated digit '9' in this number

If the given number is 1015, the program should return 2 because there are 2 non-repeated digits in this number, '0', and '5'.

If the given number is 108, the program should return 3 because there are 3 non-repeated digits in this number, '1', '0', and '8'.

If the given number is 22, the function should return 0 because there are NO non-repeated digits in this number.

For example:

Input	Result
292	1
1015	2
108	3
22	0

```
n=int(input())
l=[]
k=[]
while n>0:
    a=n%10
    n=n//10
    l.append(a)
for i in range(len(l)):
    if l.count(l[i])==1:
```

```
k.append(l[i])  
print(len(k))
```

	Input	Expected	Got

Prime Checking

Write a program that finds whether the given number N is Prime or not. If the number is prime, the program should return 2 else it must return 1.

Assumption: $2 \leq N \leq 5000$, where N is the given number.

Example1: if the given number N is 7, the method must return 2

Example2: if the given number N is 10, the method must return 1

For example:

Input	Result
7	2
10	1

```
a=int(input())
for i in range(2,a):
    if(a%2==0):
        flag=0
    elif(a%i!=0):
        flag=1
    else:
        flag=0
    if(flag==1):
        print("2")
    elif(flag==0):
        print("1")
```

Nth Fibonacci

Write a program to return the nth number in the fibonacci series. The value of N will be passed to the program as input.

NOTE: Fibonacci series looks like –

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, . . . and so on.

i.e. Fibonacci series starts with 0 and 1, and continues generating the next number as the sum of the previous two numbers.

- first Fibonacci number is 0,
- second Fibonacci number is 1,
- third Fibonacci number is 1,
- fourth Fibonacci number is 2,
- fifth Fibonacci number is 3,
- sixth Fibonacci number is 5,
- seventh Fibonacci number is 8, and so on.

For example:

Input:

7

Output

8

a=[0,1]

for i in range(0,100):

a.append(a[-1]+a[-2])

```
q=int(input())
```

```
print(a[q-1])
```

Disarium Number

A Number is said to be Disarium number when the sum of its digit raised to the power of their respective positions becomes equal to the number itself. Write a program to print number is Disarium or not.

Input Format:

Single Integer Input from stdin.

Output Format:

Yes or No.

Example Input:

175

Output:

Yes

Explanation

$$1^1 + 7^2 + 5^3 = 175$$

Example Input:

123

Output:

No

For example:

Inp ut	Res ult
175	Yes
123	No

```
import math
```

```

n=int(input())

a=len(str(n))

sum=0

x=n

while(x!=0):

    r=x%10

    sum=int(sum+math.pow(r,a))

    a-=1

    x=x//10

if(sum==n):

    print("Yes")

else:

    print("No")

```

	Input	Expected	Got

Sum of Series

Write a program to find the sum of the series $1 + 11 + 111 + 1111 + \dots + n$ terms (n will be given as input from the user and sum will be the output)

Sample Test Cases

Test Case 1

Input

4

Output

1234

Explanation:

as input is 4, have to take 4 terms.

$1 + 11 + 111 + 1111$

Test Case 2

Input

6

Output

123456

For example:

Input	Result
3	123

n=int(input())

b=1

sum=0

```
for i in range(1,n+1):
```

```
    sum+=b
```

```
    b=(b*10)+1
```

```
print(sum)
```

	Input	Expected	Got

Unique Digit Count

Write a program to find the count of unique digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number ≥ 1 and ≤ 25000 .

For e.g.

If the given number is 292, the program should return 2 because there are only 2 unique digits '2' and '9' in this number

If the given number is 1015, the program should return 3 because there are 3 unique digits in this number, '1', '0', and '5'.

For example:

Input	Result
292	2
1015	3

```
a=int(input())
```

```
b=[]
```

```
while a>0:
```

```
    c=a%10
```

```
    a=a//10
```

```
    b.append(c)
```

```
b=list(set(b))
```

```
print(len(b))
```

	Input	Expected	Got

Balanced Array

Given an array of numbers, find the index of the smallest array element (the pivot), for which the sums of all elements to the left and to the right are equal. The array may not be reordered.

Example

arr=[1,2,3,4,6]

- the sum of the first three elements, $1+2+3=6$. The value of the last element is 6.
- Using zero based indexing, arr[3]=4 is the pivot between the two subarrays.
- The index of the pivot is 3.

Constraints

- $3 \leq n \leq 10^5$
- $1 \leq \text{arr}[i] \leq 2 \times 10^4$, where $0 \leq i < n$
- It is guaranteed that a solution always exists.

The first line contains an integer n, the size of the array arr.

Each of the next n lines contains an integer, arr[i], where $0 \leq i < n$.

Sample Case 0

Sample Input 0

4
1
2
3
3

Sample Output 0

2

Explanation 0

The sum of the first two elements, $1+2=3$. The value of the last element is 3

Using zero based indexing, arr[2]=3 is the pivot between the two subarrays

The index of the pivot is 2

Sample Case 1

Sample Input 1

3
1
2
1

Sample Output 1

1

Explanation 1

The first and last elements are equal to 1

Using zero based indexing, arr[1]=2 is the pivot between the two subarrays

The index of the pivot is 1.

For example:

Input	Result
4	2
1	
2	
3	
3	
3	1
1	
2	
1	

```
a=int(input())
l=[]
for i in range(a):
    c=int(input())
    l.append(c)
for i in range(1,a):
    d=sum(l[0:i])
    r=sum(l[i+1:])
    if(d==r):
        print(i)

Find the Factor

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the p^{th} element of the [list](#), sorted ascending. If there is no p^{th} element, return 0.

Constraints

$$1 \leq n \leq 10^{15}$$

$$1 \leq p \leq 10^9$$

The first line contains an integer n , the number to factor.

The second line contains an integer p , the 1-based index of the factor to return.

Sample Case 0

Sample Input 0

10

3

Sample Output 0

5

Explanation 0

Factoring $n = 10$ results in $\{1, 2, 5, 10\}$. Return the $p = 3^{\text{rd}}$ factor, 5, as the answer.

Sample Case 1

Sample Input 1

10

5

Sample Output 1

0

Explanation 1

Factoring $n = 10$ results in $\{1, 2, 5, 10\}$. There are only 4 factors and $p = 5$, therefore 0 is returned as the answer.

Sample Case 2

Sample Input 2

1

1

Sample Output 2

1

Explanation 2

Factoring $n = 1$ results in $\{1\}$. The $p = 1^{\text{st}}$ factor of 1 is returned as the answer.

For example:

Input	Result
10	5
3	
10 5	0
1 1	1

```
import sys
import math

def find_factors(n):
    factors = []
    for i in range(1, int(math.sqrt(n)) + 1):
        if n % i == 0:
            factors.append(i)
            if i != n // i:
                factors.append(n // i)
    return sorted(factors)

def get_pth_factor(n, p):
    factors = find_factors(n)
```

```

if p <= len(factors):
    return factors[p - 1]
else:
    return 0

# Reading input directly from the standard input (typically for competitive
# programming)

input = sys.stdin.read

data = input().split()

n = int(data[0])
p = int(data[1])

# Calculate and print the p-th factor

print(get_pth_factor(n, p))

```

Print Element Location

Write a program to print all the locations at which a particular element (taken as input) is found in a list and also print the total number of times it occurs in the list. The location starts from 1.

For example, if there are 4 elements in the array:

5
6
5
7

If the element to search is 5 then the output will be:

5 is present at location 1
5 is present at location 3
5 is present 2 times in the array.

Sample Test Cases

Test Case 1

Input

4
5
6
5
7
5

Output

5 is present at location 1.
5 is present at location 3.
5 is present 2 times in the array.

Test Case 2

Input

5
67
80

```
45  
97  
100  
50
```

Output

```
50 is not present in the array.
```

```
def find_element_locations(lst, target):  
  
    locations = []  
  
    count = 0  
  
    for i in range(len(lst)):  
  
        if lst[i] == target:  
  
            locations.append(i + 1)  
  
            count += 1  
  
  
    return locations, count
```

```
def main():  
  
    n = int(input())  
  
    lst = [int(input()) for _ in range(n)]  
  
    target = int(input())
```

```
locations, count = find_element_locations(lst, target)
```

```
if count == 0:  
  
    print(f"{target} is not present in the array.")
```

```

else:
    for loc in locations:
        print(f'{target} is present at location {loc}.')
    print(f'{target} is present {count} times in the array.')

if __name__ == '__main__':
    main()

```

	Input	Expected
✓	4 5 6 5 7 5	5 is present at location 1. 5 is present at location 3. 5 is present 2 times in the array.
✓	5 67 80 45 97 100 50	50 is not present in the array.

First N Common Chars

Two string values S1, S2 are passed as the input. The program must print first N characters present in S1 which are also present in S2.

Input Format:

The first line contains S1.
The second line contains S2.
The third line contains N.

Output Format:

The first line contains the N characters present in S1 which are also present in S2.

Boundary Conditions:

$2 \leq N \leq 10$
 $2 \leq \text{Length of S1, S2} \leq 1000$

Example Input/Output 1:

Input:

abcbde
cdefghbb
3

Output:

bcd

Note:

b occurs twice in common but must be printed only once.

```
a=input()  
b=input()  
C="  
d=int(input())
```

```
for i in range(len(a)):  
    if(len(C)-d==0):  
        break  
    else:  
        if(a[i]in b):  
            if(a[i] not in C):

Return Second Word in Uppercase

Write a program that takes as input a string (sentence), and returns its second word in uppercase.

For example:

If input is “Wipro Technologies Bangalore” the function should return “TECHNOLOGIES”

If input is “Hello World” the function should return “WORLD”

If input is “Hello” the program should return “LESS”

NOTE 1: If input is a sentence with less than 2 words, the program should return the word “LESS”.

NOTE 2: The result should have no leading or trailing spaces.

For example:

Input Result

Wipro Technologies Bangalore

TECHNOLOGIES

Hello World

WORLD

Hello

LESS

```
f=input()
s=f.split()
if len(s)>1:
    c=s[1]
    print(c.upper())
else:
    print("LESS")

Abundant Number

An abundant number is a number for which the sum of its proper divisors is greater than the number itself. Proper divisors of the number are those that are strictly lesser than the number.

Input Format:

Take input an integer from stdin

Output Format:

Return Yes if given number is Abundant. Otherwise, print No

Example input:

12

Output:

Yes

Explanation

The proper divisors of 12 are: 1, 2, 3, 4, 6, whose sum is $1 + 2 + 3 + 4 + 6 = 16$. Since sum of proper divisors is greater than the given number, 12 is an abundant number.

Example input:

13

Output:

No

Explanation

The proper divisors of 13 is: 1, whose sum is 1. Since sum of proper divisors is not greater than the given number, 13 is not an abundant number.

For example:

Test	Result
------	--------

print(abundant(12))	Yes
---------------------	-----

print(abundant(13))	No
---------------------	----

```
def abundant(n):
```

```
    l,s=[],0
```

```
    for i in range(1,int(n//2)+1):
```

```
        if(n%i==0):
```

```
            l.append(i)
```

```
for i in l:
```

```
    s+=i
```

```
if(s>n):
```

```

Automorphic number or not

An automorphic number is a number whose square ends with the number itself. For example, 5 is an automorphic number because $5*5 = 25$. The last digit is 5 which same as the given number.

If the number is not valid, it should display “Invalid input”.

If it is an automorphic number display “Automorphic” else display “Not Automorphic”.

Input Format:

Take a Integer from Stdin

Output Format:

Print Automorphic if given number is Automorphic number, otherwise Not Automorphic

Example input: 5 Output: Automorphic Example input: 25 Output: Automorphic

Example input: 7 Output: Not Automorphic

For example:

Test	Result
<code>print(automorphic(5))</code>	Automorphic

```

Check Product of Digits

Write a code to check whether product of digits at even places is divisible by sum of digits at odd place of a positive integer.

Input Format:

Take an input integer from stdin.

Output Format:

Print TRUE or FALSE.

Example Input:

1256

Output:

TRUE

Example Input:

1595

Output:

FALSE

For example:

Test	Result
print(productDigits(1256))	True
print(productDigits(1595))	False

```
def productDigits(n):
    a=str(n)
    s,p=0,1
    for i in range(0,len(a),2):
        s+=int(a[i])
    for i in range(1,len(a),2):
        p*=int(a[i])
    if(p%s==0):
        return("True")
    else:
        return("False")
```

Christmas Discount

An e-commerce company plans to give their customers a special discount for Christmas. They are planning to offer a flat discount. The discount value is calculated as the sum of all the prime digits in the total bill amount.

Write an python code to find the discount value for the given total bill amount.

Constraints

$1 \leq \text{orderValue} < 10^{100000}$

Input

The input consists of an integer `orderValue`, representing the total bill amount.

Output

Print an integer representing the discount value for the given total bill amount.

Example Input

578

Output

12

For example:

Test	Result
<code>print(christmasDiscount(578))</code>	12

```
def christmasDiscount(n):
    res=0
    while n!=0:
        rem=n%10
        flag=0
        for i in range(1,rem+1):
```

```
if rem%i==0:  
    flag+=1  
  
if flag==2:  
    res=res+rem  
  
n=n//10  
  
  
return res
```

Coin Change

complete function to implement coin change making problem i.e. finding the minimum number of coins of certain denominations that add up to given amount of money.

The only available coins are of values 1, 2, 3, 4

Input Format:

Integer input from stdin.

Output Format:

return the minimum number of coins required to meet the given target.

Example Input:

16

Output:

4

Explanation:

We need only 4 coins of value 4 each

Example Input:

25

Output:

7

Explanation:

We need 6 coins of 4 value, and 1 coin of 1 value

```
def coinChange(amount):
```

```
    # Available coin denominations
```

```
    coins = [1, 2, 3, 4]
```

```
    # Initialize a list to store the minimum number of coins for each amount
    # from 0 to the target amount
```

```

dp = [float('inf')] * (amount + 1)

dp[0] = 0 # Base case: 0 coins needed to make amount 0

# Iterate through all amounts from 1 to the target amount

for i in range(1, amount + 1):

    # Iterate through all available coin denominations

    for coin in coins:

        # If the current coin denomination is less than or equal to the current
        # amount

        if coin <= i:

            # Update dp[i] to be the minimum between its current value and
            # dp[i - coin] + 1

            dp[i] = min(dp[i], dp[i - coin] + 1)

# The result is stored at dp[amount]

return dp[amount]

amount = int(input())

print(coinChange(amount))

```

Difference Sum

Given a number with maximum of 100 digits as input, find the difference between the sum of odd and even position digits.

Input Format:

Take a number in the form of String from stdin.

Output Format:

Print the difference between sum of even and odd digits

Example input:

1453

Output:

1

Explanation:

Here, sum of even digits is $4 + 3 = 7$

sum of odd digits is $1 + 5 = 6$.

Difference is 1.

Note that we are always taking absolute difference

```
def differenceSum(n):
```

```
    a=[]
```

```
    b=[]
```

```
    k=str(n)
```

```
    for i in range(len(k)):
```

```
        if int(i)%2==0:
```

```
            a.append(int(k[i]))
```

```
        else:
```

```
            b.append(int(k[i]))
```

```
s=sum(b)
```

```
r=sum(a)
```

```
j=s-r
```

```
return j
```

Ugly number

A number is considered to be ugly if its only prime factors are 2, 3 or 5.
[1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, ...] is the sequence of ugly numbers.

Task:

complete the function which takes a number n as input and checks if it's an ugly number.
return ugly if it is ugly, else return not ugly

Hint:

An ugly number U can be expressed as: $U = 2^a * 3^b * 5^c$, where a, b and c are nonnegative integers.

For example:

Test	Result
print(checkUgly(6))	ugly
print(checkUgly(21))	not ugly

```
def checkUgly(n):
    for i in range(n):
        for j in range(n):
            for k in range(n):
                if(n==(2**i)+(3**j)+(5**k)):
                    return("ugly")
    return("not ugly")
```

	Test	Expected	Got	
✓	print(checkUgly(6))	ugly	ugly	✓
✓	print(checkUgly(21))	not ugly	not ugly	✓

Binary String

Coders here is a simple task for you, Given string str. Your task is to check whether it is a binary string or not by using python set.

Examples:

Input: str = "01010101010"

Output: Yes

Input: str = "REC101"

Output: No

For example:

Input	Result
01010101010	Yes
010101 10101	No

```
a = input()
```

```
try:
```

```
    c = int(a)
```

```
    print("Yes")
```

```
except:
```

```
    print("No")
```

	Input	Expected	Got	
✓	01010101010	Yes	Yes	✓
✓	REC123	No	No	✓
✓	010101 10101	No	No	✓

Check Pair

Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to K.

Examples:

Input: t = (5, 6, 5, 7, 7, 8), K = 13

Output: 2

Explanation:

Pairs with sum K(= 13) are { (5, 8), (6, 7), (6, 7) }.

Therefore, distinct pairs with sum K(= 13) are { (5, 8), (6, 7) }.

Therefore, the required output is 2.

For example:

Input	Result
1,2,1,2,5	1
3	
1,2	0
0	

```
t = input()  
k = int(input())  
a = t.split(",")  
l = [int(x) for x in a]  
count = 0  
x = set()
```

```

for i in range(len(l)):
    for j in range(i + 1, len(l)):
        if l[i] + l[j] == k:
            s = (l[i], l[j])
            if s not in x and (l[j], l[i]) not in x:
                count += 1
                x.add(s)

print(count)

```

	Input	Expected	Got

DNA Sequence

The **DNA sequence** is composed of a series of nucleotides abbreviated as '**A**', '**C**', '**G**', and '**T**'.

For example, "**ACGAATTCCG**" is a **DNA sequence**.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string **s** that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

Example 1:

Input: s = "AAAAAACCCCCAAAAACCCCCCAAAAAGGGTTT"

Output: ["AAAAAACCCCC", "CCCCCAAAAA"]

Example 2:

Input: s = "AAAAAAAAAAAAAA"

Output: ["AAAAAAAAAA"]

For example:

Input	Result
AAAAAACCCCCAAAAACCCCCCAAAAAGGGTTT	AAAAAACCCCC CCCCCAAAAA

```
s = input()  
j = []  
repeated = set()  
for i in range(len(s) - 9):  
    sequence = s[i:i+10]
```

```

if sequence in j:
    repeated.add(sequence)
else:
    j.append(sequence)

l=list(repeated)
l=list(reversed(l))

for i in l:
    print(i)

```

Remove repeated

Write a program to eliminate the common elements in the given 2 arrays and print only the non-repeating elements and the total number of such non-repeating elements.

Input Format:

The first line contains space-separated values, denoting the size of the two arrays in integer format respectively.

The next two lines contain the space-separated integer arrays to be compared.

Sample Input:

5 4

1 2 8 6 5

2 6 8 10

Sample Output:

1 5 10

3

Sample Input:

5 5

1 2 3 4 5

1 2 3 4 5

Sample Output:

NO SUCH ELEMENTS

For example:

Input	Result
5 4	1 5 10

Input	Result
1 2 8 6 5	3
2 6 8 10	

```

a=input()
d=[]
b=input()
c=input()
b=tuple(b.split(" "))
c=tuple(c.split(" "))
for i in b:
    if i not in c:
        d.append(i)
for i in c:
    if i not in b:

American keyboard

Given an array of strings words, return *the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.*

In the **American keyboard**:

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm"

Example 1:

Input: words = ["Hello", "Alaska", "Dad", "Peace"]

Output: ["Alaska", "Dad"]

Example 2:

Input: words = ["omk"]

Output: []

Example 3:

Input: words = ["adsdf", "sfd"]

Output: ["adsdf", "sfd"]

For example:

Input	Result
4	Alaska

Input	Result
Hello	Dad
Alaska	
Dad	
Peace	

```

def findWords(words):

    row1 = set('qwertyuiop')
    row2 = set('asdfghjkl')
    row3 = set('zxcvbnm')

    result = []

    for word in words:
        w = set(word.lower())
        if w.issubset(row1) or w.issubset(row2) or w.issubset(row3):
            result.append(word)

    if len(result) == 0:
        print("No words")
    else:
        for i in result:
            print(i)

Uncommon words

A sentence is a string of single-space separated words where each word consists only of lowercase letters. A word is uncommon if it appears exactly once in one of the sentences, and does not appear in the other sentence.

Given two sentences s1 and s2, return a list of all the uncommon words. You may return the answer in any order.

Example 1:

Input: s1 = "this apple is sweet", s2 = "this apple is sour"

Output: ["sweet", "sour"]

Example 2:

Input: s1 = "apple apple", s2 = "banana"

Output: ["banana"]

Constraints:

$1 \leq s1.length, s2.length \leq 200$

s1 and s2 consist of lowercase English letters and spaces.

s1 and s2 do not have leading or trailing spaces.

All the words in s1 and s2 are separated by a single space.

Note:

Use dictionary to solve the problem

For example:

Input	Result
this apple is sweet	sweet sour
this apple is sour	

```

a=input().split()
b=input().split()
c1,c2,l={},{},[]
for i in a:
    c1[i]=c1.get(i,0)+1
for j in b:
    c2[j]=c2.get(j,0)+1
for w,c in c1.items():
    if(c==1 and w not in b):
        l.append(w)
for w,c in c2.items():
    if(c==1 and w not in a):
        l.append(w)
print(*l)

```

	Input	Expected	Got

Winner of Election

Given an array of names of candidates in an election. A candidate name in the array represents a vote cast to the candidate. Print the name of candidates received Max vote. If there is tie, print a lexicographically smaller name.

Examples:

Input : votes[] = {"john", "johnny", "jackie",
 "johnny", "john", "jackie",
 "jamie", "jamie", "john",
 "johnny", "jamie", "johnny",
 "john"};

Output : John

We have four Candidates with name as 'John', 'Johnny', 'jamie', 'jackie'. The candidates John and Johny get maximum votes. Since John is alphabetically smaller, we print it. Use dictionary to solve the above problem

Sample Input:

10
John
John
Johny
Jamie
Jamie
Johny
Jack
Johny
Johny
Jackie

Sample Output:

Johny

For example:

Input	Result
10	Johny

Input	Result
John	
John	
Johny	
Jamie	
Jamie	
Johny	
Jack	
Johny	
Johny	
Jackie

Scramble Score

In the game of Scrabble™, each letter has points associated with it. The total score of a word is the sum of the scores of its letters. More common letters are worth fewer points while less common letters are worth more points.

Write a program that computes and displays the Scrabble™ score for a word. Create a dictionary that maps from letters to point values. Then use the dictionary to compute the score.

A Scrabble™ board includes some squares that multiply the value of a letter or the value of an entire word. We will ignore these squares in this exercise.

The points associated with each letter are shown below:

Points Letters

1 A, E, I, L, N, O, R, S, T and U

2 D and G

3 B, C, M and P

4 F, H, V, W and Y

5 K

8 J and X

10 Q and Z

Sample Input

REC

Sample Output

REC is worth 5 points.

```
letter_scores = {
    'A': 1, 'E': 1, 'T': 1, 'L': 1, 'N': 1, 'O': 1, 'R': 1, 'S': 1, 'U': 1,
    'D': 2, 'G': 2,
    'B': 3, 'C': 3, 'M': 3, 'P': 3,
    'F': 4, 'H': 4, 'V': 4, 'W': 4, 'Y': 4,
    'K': 5,
```

```

'J': 8, 'X': 8,
'Q': 10, 'Z': 10
}
word = input().upper()
score = sum(letter_scores.get(letter, 0) for letter in word)
print(word,"is worth",score,"points.")

```

	Input	Expected	Got	
✓	GOD	GOD is worth 5 points.	GOD is worth 5 points.	✓
✓	REC	REC is worth 5 points.	REC is worth 5 points.	✓

Merge Sort

Write a Python program to sort a list of elements using the merge sort algorithm.

For example:

Input	Result
5	3 4 5 6 8
6 5 4 3 8	

```
a=int(input())
l=[]
l.extend(input().split())
for i in range(a-1):
    for j in range(a-1):
        if(int(l[j])>int(l[j+1])):
            t=int(l[j])
            l[j]=int(l[j+1])
            l[j+1]=t
for i in range(a):
    print(int(l[i]),end=" ")
```

	Input	Expected	Got
✓	5 6 5 4 3 8	3 4 5 6 8	3 4 5 6 8

Bubble Sort

Given an listof integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

1. List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted list.
3. Last Element: lastElement, the *last* element in the sorted list.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.

First Element: 1

Last Element: 6

Input Format

The first line contains an integer,n , the size of the list a .
The second line contains n, space-separated integers a[i].

Constraints

- $2 \leq n \leq 600$
- $1 \leq a[i] \leq 2 \times 10^6$.

Output Format

You must print the following three lines of output:

1. List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted list.
3. Last Element: lastElement, the *last* element in the sorted list.

Sample Input 0

3

1 2 3

Sample Output 0

List is sorted in 0 swaps.

First Element: 1

Last Element: 3

For example:

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9

```
def bubble_sort(arr):
    n = len(arr)
    swaps = 0

    for i in range(n):
        for j in range(0, n-i-1):
            if arr[j] > arr[j + 1]:
                # Swap elements
                arr[j], arr[j + 1] = arr[j + 1], arr[j]
                swaps += 1

    return swaps

# Input the size of the list
n = int(input())

# Input the list of integers
arr = list(map(int, input().split()))

# Perform bubble sort and count the number of swaps
```

```

num_swaps = bubble_sort(arr)

# Print the number of swaps
print("List is sorted in", num_swaps, "swaps.")

# Print the first element
print("First Element:", arr[0])

# Print the last element
print("Last Element:", arr[-1])

```

	Input	Expected	Got	
✓	3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3	List is sorted in 3 swaps. First Element: 1 Last Element: 3	✓
✓	5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9	List is sorted in 4 swaps. First Element: 1 Last Element: 9	✓

Peak Element

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element $a[i]$ is a peak element if

$A[i-1] \leq A[i] \geq A[i+1]$ for middle elements. $[0 < i < n-1]$

$A[i-1] \leq A[i]$ for last element $[i=n-1]$

$A[i] \geq A[i+1]$ for first element $[i=0]$

Input Format

The first line contains a single integer n , the length of A .
The second line contains n space-separated integers, $A[i]$.

Output Format

Print peak numbers separated by space.

Sample Input

5

8 9 10 2 6

Sample Output

10 6

For example:

Input	Result
4	12 8
12 3 6 8	

```
def find_peak(arr):
    peak_elements = []
```

```
# Check for the first element

WEEK 12:

1.

Ex. No. : 12.1

Date: 7.6.2024

Register No.: 231501167

Name: SURYA PRAJIN S

As a software engineer at SocialLink, a leading social networking application, you are tasked with developing a new feature designed to enhance user interaction and engagement. The company aims to introduce a system where users can form connections based on shared interests and activities. One of the feature's components involves analyzing pairs of users based on the activities they've participated in, specifically looking at the numerical difference in the number of activities each user has participated in.

Your task is to write an algorithm that counts the number of unique pairs of users who have a specific absolute difference in the number of activities they have participated in. This algorithm will serve as the backbone for a larger feature that recommends user connections based on shared participation patterns.

Problem Statement

Given an array `activities` representing the number of activities each user has participated in and an integer `k`, your job is to return the number of unique pairs (i, j) where $activities[i] - activities[j] = k$, and $i < j$. The absolute difference between the activities should be exactly `k`.

For the purposes of this feature, a pair is considered unique based on the index of activities, not the value. That is, if there are two users with the same number of activities, they are considered distinct entities.

Input Format

The first line contains an integer, n, the size of the array nums.

The second line contains n space-separated integers, nums[i].

The third line contains an integer, k.

Output Format

Return a single integer representing the number of unique pairs (i, j)

where $| \text{nums}[i] - \text{nums}[j] | = k$ and $i < j$.

Constraints:

$$1 \leq n \leq 10^5$$

$$-10^4 \leq \text{nums}[i] \leq 10^4$$

$$0 \leq k \leq 10^4$$

For example:

Input	Result
5 1 3 1 5 4 0	1
4 1 2 2 1 1	4

```
def count_pairs_with_difference_k(activities, k):
```

```
    count = 0
```

```
    n = len(activities)
```

```
    for i in range(n):
```

```
        for j in range(i + 1, n):
```

```
            if abs(activities[i] - activities[j]) == k:
```

```
                count += 1
```

```
    return count
```

```

# Reading input
n = int(input())
activities = list(map(int, input().split()))
k = int(input())

# Calling function and printing the result
print(count_pairs_)

```

OUTPUT:

	Input	Expecte d	Go t	
	4 1 2 3 4 1	3	3	
	5 1 3 1 5 4 0	1	1	
	4 1 2 2 1 1	4	4	

Passed all tests!

3.

Ex. No. : 12.3

Date: 7.6.2024

Register No.: 231501167

Name: SURYA PRAJIN S

3. Background:

Dr. John Wesley maintains a spreadsheet with student records for academic evaluation. The spreadsheet contains various data fields including student IDs, marks, class names, and student names. The goal is to develop a system that can calculate the average marks of all students listed in the spreadsheet.

Problem Statement:

Create a Python-based solution that can parse input data representing a list of students with their respective marks and other details, and compute the average marks. The input may present these details in any order, so the solution must be adaptable to this variability.

Input Format:

The first line contains an integer N, the total number of students.

The second line lists column names in any order (ID, NAME, MARKS, CLASS).

The next N lines provide student data corresponding to the column headers.

Output Format:

A single line containing the average marks, corrected to two decimal places.

Constraints:

1≤N≤100

Column headers will always be in uppercase and will include ID, MARKS, CLASS, and NAME.

Marks will be non-negative integers.

For example:

Input	Result
3 ID NAME MARKS CLASS 101 John 78 Science 102 Doe 85 Math 103 Smith 90 History	84.33
3 MARKS CLASS NAME ID 78 Science John 101 85 Math Doe 102 90 History Smith 103	84.33

```

def calculate_average_marks(data):

    total_marks = 0

    num_students = 0

    for student in data:

        if 'MARKS' in student:

            total_marks += int(student['MARKS'])

            num_students += 1

    if num_students == 0:

        return 0

    return total_marks / num_students

# Read input

N = int(input())

columns = input().split()

# Initialize data structure to store student records

students = []

```

```

# Read student data

for _ in range(N):
    student_data = input().split()
    student_record = {columns[i]: student_data[i] for i in range(len(columns))}

    students.append(student_record)

# Calculate average marks

average_marks = calculate_average_marks(students)

# Print average marks with two decimal places

print("{:.2f}".format(average_marks))

```

OUTPUT:

	Input	Expecte d	Got	
	3 ID NAME MARKS CLASS 101 John 78 Science 102 Doe 85 Math 103 Smith 90 History	84.33	84.3 3

Ex. No. : 12.4

Date: 7.6.2024

Register No.: 231501167

Name: SURYA PRAJIN S

Background:

Raghu owns a shoe shop with a varying inventory of shoe sizes. The shop caters to multiple customers who have specific size requirements and are willing to pay a designated amount for their desired shoe size. Raghu needs an efficient system to manage his inventory and calculate the total revenue generated from sales based on customer demands.

Problem Statement:

Develop a Python program that manages shoe inventory and processes sales transactions to determine the total revenue generated. The program should handle inputs of shoe sizes available in the shop, track the number of each size, and match these with customer purchase requests. Each transaction should only proceed if the desired shoe size is in stock, and the inventory should update accordingly after each sale.

Input Format:

First Line: An integer X representing the total number of shoes in the shop.

Second Line: A space-separated list of integers representing the shoe sizes in the shop.

Third Line: An integer N representing the number of customer requests.

Next N Lines: Each line contains a pair of space-separated values:

The first value is an integer representing the shoe size a customer desires.

The second value is an integer representing the price the customer is willing to pay for that size.

Output Format:

Single Line: An integer representing the total amount of money earned by Raghu after processing all customer requests.

Constraints:

$1 \leq X \leq 1000$ — Raghu's shop can hold between 1 and 1000 shoes.

Shoe sizes will be positive integers typically ranging between 1 and 30.

$1 \leq N \leq 1000$ — There can be up to 1000 customer requests in a single batch.

The price offered by customers will be a positive integer, typically ranging from \$5 to \$100 per shoe.

For example:

Input	Result
10 2 3 4 5 6 8 7 6 5 18 6 6 55 6 45 6 55 4 40 18 60 10 50	200
5 5 5 5 5 5 5 5 10 5 10 5 10 5 10 5 10	50

Answer:(penalty regime: 0 %)

class ShoeInventory:

```
def __init__(self, shoe_sizes):
    self.inventory = {size: 0 for size in shoe_sizes}
```

```
def add_shoes(self, size, quantity):
    self.inventory[size] += quantity
```

```
def sell_shoes(self, size):
    if self.inventory.get(size, 0) > 0:
        self.inventory[size] -= 1
        return True
    return False
```

class TransactionManager:

```
def __init__(self, shoe_inventory):
    self.shoe_inventory = shoe_inventory
```

```

        self.total_revenue = 0

def process_transactions(self, customer_requests):
    for size, price in customer_requests:
        if self.shoe_inventory.sell_shoes(size):
            self.total_revenue += price

# Read input
X = int(input()) # Total number of shoes
shoe_sizes = list(map(int, input().split())) # Shoe sizes available
N = int(input()) # Number of customer requests

# Initialize shoe inventory
inventory = ShoeInventory(shoe_sizes)

# Populate initial inventory
for size in shoe_sizes:
    inventory.add_shoes(size, X // len(shoe_sizes))

# Initialize transaction manager
transaction_manager = TransactionManager(inventory)

# Process transactions
for _ in range(N):
    size, price = map(int, input().split())
    transaction_manager.process_transactions([(size, price)])

# Print total revenue
print(transaction_manager.total_revenue)

```

OUTPUT:

	Input	Expected	Got	
	10 2 3 4 5 6 8 7 6 5 18 6 6 55 6 45 6 55 4 40 18 60 10 50	200	200	
	5 5 5 5 5 5 5 5 10 5 10 5 10 5 10 5 10	50	50	
	4 4 4 6 6 5 4 25 4 25 6 30 6 55 6 55	135	135

Name: SURYA PRAJIN S

Background:

Rose manages a personal library with a diverse collection of books. To streamline her library management, she needs a program that can categorize books based on their genres, making it easier to find and organize her collection.

Problem Statement:

Develop a Python program that reads a series of book titles and their corresponding genres from user input, categorizes the books by genre using a dictionary, and outputs the list of books under each genre in a formatted manner.

Input Format:

The input will be provided in lines where each line contains a book title and its genre separated by a comma.

Input terminates with a blank line.

Output Format:

For each genre, output the genre name followed by a colon and a list of book titles in that genre, separated by commas.

Constraints:

Book titles and genres are strings.

Book titles can vary in length but will not exceed 100 characters.

Genres will not exceed 50 characters.

The number of input lines (book entries) will not exceed 100 before a blank line is entered.

For example:

Input	Result
Introduction to Programming, Programming Advanced Calculus, Mathematics	Programming: Introduction to Programming Mathematics: Advanced Calculus
Fictional Reality, Fiction Another World, Fiction	Fiction: Fictional Reality, Another World

```
def categorize_books_sorted():
```

```
    books = []
```

```
    while True:
```

```
        try:
```

```
            user_input = input().strip()
```

```

except EOFError:
    break

if not user_input:
    break

title, genre = user_input.split(',')
genre = genre.strip()

if genre in books:
    books[genre].append(title)
else:
    books[genre] = [title]

for genre in sorted(books.keys()):
    print(f'{genre}: {", ".join(books[genre])}')

categorize_books_sorted()

```

OUTPUT:
